THE CLAIMS DEFINING THE INVENTION ARE AS FOLLOWS:-

- 1. A device for communicating electric signals across the skin layer of a patient, wherein said device includes: an electrically conductive core capable of forming an EMF flux loop; first and second coils, which are in EMF communication with said electrical conductive core and wherein said first coil is positioned externally to said patient and surrounds at least a first portion of said electrically conductive core; and said second coil is implanted beneath or in said skin layer and surrounds at least a second portion of said electrically conductive core.
- 2. The device as claimed in claim 1, wherein said electrically conductively core is implanted at least partially within said skin layer.
- The device as claimed in claim 1, wherein said electrically conductively core is formed in a loop or ring-like configuration.
- 4. The device as claimed in claim 3, wherein said electrically conductively core does not breach an outer surface of said skin layer.
- 5. The device as claimed in claim 1, wherein said device includes a sleeper ring to interact with said first coil.
- 6. The device as claimed in claim 1, wherein said device includes a textured surface on at least a portion of said electrically conductively core.
- 7. The device claimed in claim 1, wherein said electrically conductive core is encapsulated within said skin layer.
- 8. The device as claimed in claim 1, wherein said device includes a layer of protective material surrounding at least a portion of the electrically conductive core.
